Summary

The late potato crop deteriorated slightly during August. Production as of September 1 was indicated to be about 2 percent less than was indicated a month earlier and about 5 percent less than in 1937. A larger crop than last year is indicated for the Central late States but smaller crops are in prospect for the Eastern and Far Western late States.

The sweetpotato prospect declined also during August but the crop as of September 1 was indicated to be 6 percent larger than in 1937. Production in the Central Atlantic States is sharply reduced from last year but in the other important areas it is increased somewhat.

Production of most of the important late truck crops this season is indicated to be substantially larger than last year. Late cabbage, both demostic and Danish types, carrots, celery, enions, green peas, and tematoes, all are indicated to be in greater supply this fall and early winter than last year. In contrast, however, production of late beets, cauliflower, eggplant, lettuce and spinach probably will be slightly smaller than in 1937. Some of the late truck crops such as Danish cabbage, carrets, celery, and onions are normally stored for the late winter market and this season all of these are indicated to be plontiful.

Although supplies of late truck crops are indicated to be generally larger than a year ago, the quantity moving to market in car lots during the first half of September was substantially less than in the corresponding period in 1937. The upward trend in motor truck shipment, which has been

TVS-21 - 2 -

evident in recent years apparently is continuing this season. Rail and boat shipments in mid-September, however, showed some seasonal increase over that of a month earlier.

than a year earlier and many were lower than in mid-August due to the pressure of relatively large supplies and because of relatively low consumer purchasing power. Prices of truck crops taken as a group usually reach a seasonal low point in Seltember and than advance rather sharply to a relatively high level in the late winter months. At New York City eastern broccoli, carrots, colory, cucumbers, Honey Dew melons, sweetpotatoes, and turnips were the only items showing higher prices in mid-September than a year earlier, while at Chicago western carrots, green corn, cucumbers, spinach, and tematoes were the only vegetables higher than in 1937. As compared with mid-August, mid-September prices of snap beans, eastern broccoli, carrets, castern cauliflower, green corn, cucumbers, Hency Dew melons, yellow enions, green peas, and tematoes were higher at New York City; and western broccoli, colory, green corn, cucumbers, yellow enions, green peas, spinach, tematoes and turnips were higher Chicago.

With the exception of sweet corn, tonatoes, and cucumbers for pickles, and possibly asparagus and spinach, the production of truck crops for canning or manufacture is indicated to be considerably larger than in 1937.

POTATOES

Potato prices at terminal markets advanced slightly during recent weeks. At New York City prices of potatoes (excluding Russet Burbanks and California White Rose) averaged 92 cents per 100 pounds in mid-September, compared with 78 cents a month parlier and with 92 cents a year ago. At Chicago, they averaged 97 cents per 100 pounds in mid-September, against \$1.03

a month earlier and \$1 a year ago. Prices of Idaho Russets declined at both New York and Chicago as marketings increased seasonally.

The late potato crop deteriorated slightly during August. Production as of September 1 (excluding the California early crop) was indicated to be 294 million bushels, compared with 309 million last year and 299 million bushels, the 1927-36 average. During August there were slight decreases of about a million bushels each in the eastern and central groups of late-potate States, and about 5 million bushels in the western States. As a result of these changes, production in the 8 eastern and 12 western States is expected to be about 8 and 11 proent, respectively, less than in 1937 while in the 10 Central States it probably will be 2 percent larger.

Marketings of potatees during recent weeks have been largely from nearby areas by motor-truck and of homegrown stock, but carlot shipments increased sharply in mid-September from the seasonal low level prevailing during August. Shipments from the late States are increasing rapidly, while those from the intermediate States are decreasing. For the country as a whole, the total carlot movement rose to 3,425 cars during the week ending September 17 and as the season advances shipments prebably will increase further. There are indications, however, that because of the distribution of the late crop this season, the motor truck probably will move a greater pertion of the crop to market than ever before. The carlot movement is expected to be unusually small, particularly for the early fall and winter menths.

110-51

SWEETPOTATOES

The prospect for the sweetpotato crop declined slightly during August, and as of September 1 indicated production was 80,055,000 bushels. The crop this season is indicated to be about 19 percent smaller than last year in the Central Atlantic Coast States where a large portion of the crop is produced for market. In the lower Atlantic and South Central States the crop this season is larger than in 1937 by about 11 and 9 percent, respectively. In the North Central States and in California production is expected to be about the same as last year. During recent weeks shipments have increased seasonally but they are far behind those of the corresponding weeks last year; apparently a larger portion of marketings this season have been moved by motor truck.

Terminal market prices of sweetpotatoes declined seasonally during recent weeks and by mid-September were substantially below those of a month earlier. Prices in the east were slightly higher than in mid-September 1937 but lower at Chicago.

LATE TRUCK CROFS

CABBAGE: Late Danish crop near record

Indications of unusually high yields on a relatively large acreage is expected to result in a near-record crop of late Darish-type cabbage this season. Production of this type as of September 1 is indicated to be 406,300 tons or about 55 percent more than was produced in 1937 and 37 percent more than the 1927-36 average production. In 1934 a record high production of 406,600 tons was produced. Because of a record high production of late domestic cabbage in 1938 of 446,400 tons, the total late cabbage crop probably will be the largest on record. It should be noted, however, that about one-half of the large late domestic crop this year is cabbage grown for kraut. Carlot shipments of cabbage have increased sharply in recent weeks, the weekly total reaching 460 cars by mid-September compared with less than 100 cars per week a month earlier and about 250 cars in mid-September 1937. During the summer a large proportion of the marketings moved by motor truck. Terminal market prices of cabbage have declined seasonally in recent weeks and in mid-September were below those of both a month and a year earlier.

CARROTS: Late crop relatively large

Production of late carrots this year is indicated to be 3,216,000 crates compared with 2,934,000 crates last year and 2,458,000 crates the 1927-36 average. Yields per acre are indicated to be smaller than last year, but the acreage planted increased sharply. This large late crop, together with increased production in most of the other groups of States set a new United States high total in the carrot crop this year. The carlot movement of carrots has been increasing in recent weeks largely because the source of supply is shifting to more distant producing areas. As the season advances, more and more of the late crop will be moved by rail. Prices of carrots at New York City have advanced slightly in recent weeks, and were higher than in

mid-September 1937, but at Chicago a tendency prevailed for prices to decline under the pressure of relatively large supplies of topped mid-western offerings.

CAULIFLOWER: Long Island acreage increased

The acreage of late cauliflower on Long Island is estimated at 4,550 acres this year, an increase of 3 percent over the acreage harvested last year and 24 percent over the 1927-36 average. Because of good growing weather in this area the crop is expected to be ready for market earlier than usual. In mid-September, Colorado with 122 cars was the principal source of the carlot movement. Cauliflower prices at terminal markets have weakened seasonally during recent weeks; in mid-September they were generally lower than a year ago.

CELERY: First late crops larger this year

Production of celery in the first section of late States is indicated to be 3,519,000 crates or 21 percent more than was produced in 1937. On the basis of an increase of about 13 percent in the acreage in the second section of late States it is likely that the crop in this area will also be larger than in 1937. These crop prospects indicate that an unusually large supply of late celery will be available this season. A considerable portion of this celery is stored for the winter marketing season.

The fall and winter acreage in California which provides the earliest new-crop movement for 1939 is smaller by about 5 percent than the acreage harvested in late 1937 and early 1938. This crop probably will be in full production by the middle of November.

Since the source of celery supplies is shifting to more distant producing areas the carlot movement had increased sharply by mid-September. New York, Oregon and Washington were the principal shipping States. Celery prices declined in recent weeks at New York City but in mid-September were slightly higher than a year earlier; at Chicago, prices rose some but were slightly below those of mid-September 1937.

LETTUCE: Late acreage decreased 10 percent

In the second section of late States the lettuce acreage is estimated to be 30,400 acres or 10 percent less than last year but about equal to the average acreage planted in this area. California, the principal State in this group with 26,500 acres this season shows a decrease of 3,000 acres from last year. California was shipping close to 930 cars per week in mid-September or slightly more than a year earlier. Torminal market prices of lettuce weakened considerably in recent weeks and by mid-September were substantially below those of both a month and a year earlier.

ONIONS: Late crop slightly larger than in 1937

A late onion crop of 10,350,000 sacks (100 pounds) was indicated by conditions on September 1. This would be 4 percent larger than the 1937 crop

TVS-21 - 7 -

and 11 percent above the 1927-36 average. In the eastern late States the crop, estimated at 3,731,000 sacks, is nearly 500,000 sacks larger than a year earlier and about 1 million larger than the average production. In the Central States the crop is indicated to be 3,448,000 sacks or slightly larger than last year but 600,000 sacks smaller than average. In the Western States 3,671,000 sacks are indicated for this year against 3,838,000 sacks last year and 3,070,000, the 1927-36 average. With the harvest of the late crop getting well under way, carlot shipments have increased sharply in recent weeks to an average of about 550 cars per week or more than double the weekly movement during the summer months. In mid-September, western sweet Spanish onion prices were slightly lower than in recent weeks and a year earlier, whereas, prices of yellow varieties were slightly higher than in mid-August but lower than in mid-September 1937.

GREEN PEAS: Production increased in second section late States

Because of a sharply increased acreage, production of green peas in the second section of late States this year totals 1,700,000 bushels, 20 percent larger than the 1937 crop. A considerable portion of this increase is attributed to the development of a new producing area in Utah in 1937 and a further expansion there in 1938. Planting of the fall crop of peas in the northern part of California has been completed and it is indicated that the acreage will be increased sharply in most of the important counties. Carlot shipments of green peas in recent weeks have been moving largely from the Central District of California, Idaho and Utah, and in somewhat heavier volume than in the corresponding period last year. Prices of green peas at terminal markets rose seasonally in recent weeks but in mid-September were somewhat below those of a year earlier.

TOMATCES: Crop in California Southern District one-fifth larger

Supplies of tomatoes are expected to continue relatively plentiful during the fall months, since the production in the Southern District of California (Late 2) is indicated to be 21 percent greater than in 1937. In the United States as a whole, a tomato crop of 25,529,000 bushels is indicated for 1938 - a new record high. This would indicate that the sharp upward trend in production and consumption of fresh tomatoes which has been in evidence the past 20 years is continuing. Because of the large supply available for market from the late States this season the carlot movement has increased sharply in recent weeks from the low level in the summer months; the movement averaged close to 1,000 cars per week in mid-September or 50 percent larger than in the corresponding weeks in 1937. Tomato prices at terminal markets in mid-September were substantially higher than a month earlier and at Chicago were somewhat higher than mid-September 1937.

NOTE: In the case of many commodities, car-lot shipments decrease as the source of supply shifts to those producing areas where the motor-truck is the principal means of transportation; available market supplies, therefore, are frequently larger than indicated by this car-lot shipment report.

1/ Total crop.

Truck crops: Commorcial acreage and production for market, average 1927-36,

TRUCK CROPS FOR CANNING OR MANUFACTURE

Although an attempt was made this season to adjust the production and pack of several of the truck crops for canning downward through acreage curtailment, unusually high yields per acre have offset these efforts to a certain extent. As a result, the production of these crops is indicated to be generally larger than a year ago. Notable exceptions, however, appear in some of the more important crops, such as sweet corn, tomatoes and cucumbers for pickles, all of which show production indications substantially below those of 1937. Although definite estimates of production of asparagus and spinach are not available, there are some indications that these crops also have been reduced.
